

What lands on the analyst's desk

Even a 1% false-positive rate becomes a flood once the benign base is large.

1,000,000 benign . 1,000 malicious . detector at 1% FPR

-> 10,000 false alarms + 1,000 real attacks = 11,000 flags to review . precision ~ 9%

red = real attack (1,000) amber = false alarm (10,000) each dot = 100 flags

The reviewer opens 11,000 flags to find 1,000 real ones. Nine in ten are noise.
